SheetForge — Spreadsheet Automation

Gig 2 portfolio · Python · 56 automated tests · real CLI outputs

What it does

- clean: trims, fixes emails/phones, coerces prices, drops dupes
- Flags invalid rows instead of silently deleting them (--report)
- summarize: group-by with sum / count / avg → table + markdown
- merge: combine two files on a key, dedupe, report overlap
- Encoding-safe (utf-8-sig / utf-8 / latin-1), CSV + XLSX + JSON out

Real demo — actual CLI output

```
$ python -m sheetforge.cli clean samples/messy.csv -o demo/out.xlsx --report demo/bad.csv --summary demo/sum
SheetForge 1.0.0 — clean samples/messy.csv
[stats] 30 rows in → 25 rows out · 5 dupes removed (3 exact + 2 email)
[stats] emails 19 valid / 6 invalid · phones 12 fixed · columns coerced: order_value
[ok] wrote 25 rows → demo/out.xlsx
[warn] 7 flagged rows → demo/bad.csv
[ok] summary → demo/summary.md
[exit] 2
```

Architecture

- cli.py — argparse commands (clean / summarize / merge), exit codes
- clean.py — pure cleaning rules, unit-tested per rule
- io.py — encoding detection + format dispatch (csv/xlsx/json)
- summarize.py — pure group-by aggregation

Quality

- 56 unit tests, all green — cleaning rules, aggregation, I/O round-trip
- Live demo on a 30-row messy file: real numbers shown in README

Real screenshots — captured from the CLI

Not mockups: live runs

Packages

- BASIC $40 · one file clean + report — delivery 3 days
- STANDARD $90 · multi-file merge + summaries — delivery 5 days
- PREMIUM $180 · scheduled run + email/Telegram output — delivery 7 days

Rules I follow

- Sample file first (fake data is fine) — scope confirmed before coding
- Deliverables: working script + short usage guide
